# EVERY POSITIVE K-BONACCI-LIKE SEQUENCE EVENTUALLY AGREES WITH A ROW OF THE K-ZECKENDORF ARRAY 

PETER G. ANDERSON AND CURTIS COOPER

#### Abstract

For $k \geq 2$, a fixed integer, we work with the $k$-bonacci sequence, $\left\{X_{n}\right\}$, a $k$ th order generalization of the Fibonacci numbers, and their use in a Zeckendorf representation of positive integers. We extend Zeckendorf representations using $\left\{X_{n} \mid n \in \mathbb{Z}\right\}$ and show that every sequence of positive integers satisfying the $k$-bonacci recurrence eventually agrees with a row of the $k$-Zeckendorf array.

Throughout this paper, $k \geq 2$ is a fixed integer.
Definition 1. The $k$-bonacci sequence $\left\{X_{n}\right\}$ is given by the recurrence

$$
\begin{array}{ll}
X_{n}=0 & \text { for }-k+2 \leq n \leq 0, \\
X_{1}=1, & \\
X_{n}=\sum_{i=1}^{k} X_{n-i} & \text { for all } n \in \mathbb{Z} .
\end{array}
$$

When $k=2,\left\{X_{n}\right\}$ is the Fibonacci sequence, when $k=3$ the tribonacci sequence, and so on. We have deliberately used $\mathbb{Z}$ as the domain of subscripts for $\left\{X_{n}\right\}$.

Our purpose herein is to generalize the following well-known theorem [6] (see also [4]). (Strictly speaking, Zeckendorf's Theorem applies to the Fibonacci numbers ( $k=2$ ), but the proof via greedy change-making applies without change to $k$-bonacci numbers.)

Theorem 1. Zeckendorf's Theorem. Every nonnegative number, n, is a unique sum of distinct $k$-bonacci numbers:

$$
n=\sum_{i \geq 2} c_{i} X_{i}
$$

such that $c_{i} \in\{0,1\}$ for all $i$, and no string of $k$ consecutive $c_{i}$ 's are equal to 1 .
Definition 2. A coefficient list is a function $d: \mathbb{Z} \rightarrow \mathbb{Z} \geq 0$ with finite support (i.e., $d(i)>0$ for only a finite number of $i$ ). In case $\prod_{i=1}^{k} d(j+i)=0$ for all $j, d$ is called weakly Zeckendorf. If, in addition, $d(i) \in\{0,1\}$ for all $i, d$ is called Zeckendorf.
Definition 3. The Zeckendorf value of a coefficient list is $Z(d)=\sum_{i \in \mathbb{Z}} d(i) X_{i}$. This is defined whether or not $d$ is (weakly) Zeckendorf.

It is easy to see that for any integer $n$, there are an infinite number of coefficient lists $d$ such that $Z(d)=n$, even an infinite number of Zeckendorf coefficient lists.
Definition 4. The sum of a coefficient list is $\sum_{i \in \mathbb{Z}} d(i)$.
Definition 5. The shift, $S d$, of a coefficient list is the coefficient list satisfying $S d(i)=d(i-1)$. We extend this notion to include the shift of a positive integer $n$. If $n$ has the unique Zeckendorf representation $n=\sum_{i=2}^{m} d(i) X_{i}$, then $S(n)=Z(S d)$.

Here is how we generalize Zeckendorf's Theorem to deal with $\left\{X_{n}\right\}$ using subscripts in $\mathbb{Z}$.

## THE FIBONACCI QUARTERLY

Theorem 2. For any sequence of $k$ non-negative integers $\left(z_{0}, z_{1}, \ldots, z_{k-1}\right)$ there is a unique Zeckendorf coefficient list d such that $z_{i}=Z\left(S^{i} d\right)$.

The proof requires a small amount of machinery.
Definition 6. The function $r: \mathbb{Z} \rightarrow\{-1,0,1\}$ expresses the $k$-bonacci defining rule:

$$
r(i)=\left\{\begin{array}{rl}
-1 & -k \leq i<0, \\
1 & i=0, \\
0 & \text { otherwise } .
\end{array}\right.
$$

Definition 7. Following the concepts of grade-school arithmetic, the carry into position $j$ of a coefficient list, $C_{j} d$, is defined by

$$
C_{j} d(i)=d(i)+r(i-j) .
$$

The carry is called proper in case $C_{j} d$ is a coefficient list (i.e., its range is in $\mathbb{Z}^{\geq 0}$ ), and is highly proper if, in addition, $d(j)=0$. The borrow from position $j, B_{j} d$, is defined by

$$
B_{j} d(i)=d(i)-r(i-j) .
$$

The borrow is called proper in case $B_{j} d$ is a coefficient list (i.e., $d(j)>0$ so the range of $B_{j} d$ is in $\mathbb{Z}^{\geq 0}$ ).

These definitions have some straightforward consequences:
(1) Carrying and borrowing are inverses of each other: $B_{j} d=C_{j}^{-1} d$.
(2) Carrying and borrowing do not change the Zeckendorf value of a coefficient list: $Z(d)=$ $Z\left(C_{j} d\right)=Z\left(B_{j} d\right)$.
(3) Carrying and borrowing commute with shifting: $B_{j+1} S d=S B_{j} d$ and $C_{j+1} S d=S C_{j} d$.

Definition 8. Call two coefficient lists, $d$ and $d^{\prime}$, equivalent if they are related by a sequence of carries and borrows: $d^{\prime}=C_{j_{m}}^{ \pm 1} \cdots C_{j_{1}}^{ \pm 1} d$.

The following lemma allows us to prove Theorem 2.
Lemma 3. Every coefficient list is equivalent to a Zeckendorf coefficient list.
Proof. First, we show that every coefficient list is equivalent to a weakly Zeckendorf coefficient list. Suppose $d(i+1), \ldots, d(i+k)$ are $k$ positive values. The equivalent coefficient list $C_{i+k+1} d$ has a smaller sum. Our claim follows by induction on the sum of the coefficient list. (Here and in the following step, we use the principle of mathematical induction that a decreasing sequence of non-negative integers must terminate.)

Next, we demonstrate that every weakly Zeckendorf coefficient list is equivalent to a Zeckendorf coefficient list. If $d$ is weakly Zeckendorf, let $i$ be the largest value for which $d(i)>1$ and $d(j), \ldots, d(i), \ldots, d\left(j^{\prime}\right)$ be positive values with $j \leq i \leq j^{\prime}, j^{\prime}-j<k-1$, and $d(j-1)=$ $d\left(j^{\prime}+1\right)=0$. Let the bad sum of the coefficient list of $d$ be $\beta(d)=\sum_{n \leq j^{\prime}} d(n)$. Produce the equivalent $d^{\prime}$ by borrowing from position $i$ and highly proper carrying into position $j^{\prime}+1$ (so $d$ and $d^{\prime}$ have the same sum): $d^{\prime}=C_{j^{\prime}+1} B_{i} d$. For $n>j^{\prime}+1, d^{\prime}(n)=d(n)$, but $d^{\prime}\left(j^{\prime}+1\right)=1$, so $\beta\left(d^{\prime}\right)<\beta(d)$, and the lemma follows by induction on the bad sum of the coefficient list. ( $d^{\prime}$ may have to be modified by some highly proper carries to convert it to weakly Zeckendorf, but that will not increase the sum of the coefficient list. In fact, it will decrease the sum of the coefficient list and the bad sum of the modified coefficient list will not increase.)

## POSITIVE K-BONACCI-LIKE SEQUENCES AND THE K-ZECKENDORF ARRAY

At this point we will give an example to demonstrate the concept of the bad sum of a coefficient list and that every weakly Zeckendorf coefficient list is equivalent to a Zeckendorf coefficient list. We will use the 3-bonacci (tribonacci) sequence

| $i$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $X_{i}$ | 0 | 1 | 1 | 2 | 4 | 7 | 13 | 24 | 44 | 81 | 149 | 274 | 504 |

Consider the weakly Zeckendorf coefficient list

| $i$ | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 1 | 4 | 0 | 2 | 1 |

The bad sum is 8 . Transforming the $d$ coefficient list by borrowing $B_{3}$ and carrying $C_{5}$ we obtain the equivalent $d$ coefficient list

| $i$ | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 2 | 5 | 0 | 0 | 0 | 1 |

The bad sum is now 7. Again, transforming the $d$ coefficient list by borrowing $B_{1}$ and carrying $C_{2}$ we obtain the equivalent $d$ coefficient list

| $i$ | -2 | -1 | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 1 | 0 | 2 | 3 | 1 | 0 | 0 | 1 |

Since $d$ is no longer weakly Zeckendorf, we need to do the carry $C_{3}$ to restore it to the weakly Zeckendorf form. We thus have the equivalent $d$ coefficient list

| $i$ | -2 | -1 | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 1 | 0 | 1 | 2 | 0 | 1 | 0 | 1 |

The bad sum is now 4 . We now borrow $B_{1}$ and carry $C_{2}$ to obtain the equivalent $d$ coefficient list

| $i$ | -2 | -1 | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 2 | 0 | 1 | 0 | 1 | 1 | 0 | 1 |

The bad sum is now 2. We finally borrow using $B_{-2}$ and carry using $C_{-1}$ to obtain the Zeckendorf coefficient list $d$.

| $i$ | -5 | -4 | -3 | -2 | -1 | 0 | 1 | 2 | 3 | 4 | 5 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | 0 | 1 |

We may now prove Theorem 2.
Proof. Because of Lemma 3, we need only display (or show how to find) an unrestricted coefficient list $d$ such that $Z\left(S^{i} d\right)$, for $0 \leq i<k$, can take on arbitrary specified values.

Let $d$ be a coefficient list with support in the interval of size $k:[-k+2,1]$. So $Z\left(S^{i} d\right)=$ $\sum_{j=0}^{i} X_{i+1-j} d(1-j)$. Because of the simple form of the values $X_{-k+2}, \ldots, X_{1}$, it is straightforward to determine $d$ to achieve any desired values for the $Z\left(S^{i} d\right)$.

## THE FIBONACCI QUARTERLY

If we are dealing with the Fibonacci numbers $(k=2)$, the support of $d$ is $[0,1]$, and $Z(d)=d(1)$ and $Z(S d)=d(0)+d(1)$. Appropriate choices of $d(0)$ and $d(1)$ can give any desired values for $Z(d)$ and $Z(S d)$.

If we are dealing with the tribonacci numbers $(k=3)$, the support of $d$ is $[-1,0,1]$, and $Z(d)=d(1), Z(S d)=d(0)+d(1)$, and $Z\left(S^{2} d\right)=d(-1)+d(0)+2 d(1)$. Appropriate choices of $d$ can give any desired values for $Z(d), Z(S d), Z\left(S^{2} d\right)$.

We continue to work with $k$-bonacci numbers for some fixed $k \geq 2$.
Definition 9. The $k$-Zeckendorf array is an infinite table of numbers $\left\{A_{i j}\right\}$ where the subscripts $i$ and $j$ range over the positive integers. The first row consists of the $k$-bonacci numbers: $A_{1 j}=X_{j+1}$. The first value in row $i$ for $i>1, A_{i 1}$ is the smallest number not appearing in any previous row. Then, subsequent values in each row follow the rule: $A_{i, j+1}=S\left(A_{i j}\right)$.

Several facts are known about these arrays $[1,2,3]$ :

- Every positive integer occurs exactly once in the array.
- The first column of the array consists of the integers $n$ such that the coefficient of $X_{2}$ in their $k$-Zeckendorf representation is 1 .

Definition 10. A positive $k$-bonacci-like sequence $\left\{W_{n}\right\}$ is a sequence of positive integers that obeys the recurrence of Definition 1: $W_{n}=\sum_{i=1}^{k} W_{n-i}$ for all $n \in \mathbb{Z}$.

Theorem 4. Every positive $k$-bonacci-like sequence, after some position, occurs as a row of the $k$-Zeckendorf array.

Proof. Let $d$ be the Zeckendorf coefficient list satisfying $Z\left(S^{i} d\right)=W_{i}$ for $0 \leq i<k$. (Note that $W_{i}=Z\left(S^{i} d\right)$ for all $i$.) Let $m=\min \{n \mid d(n)=1\}$. There are two cases.

Case 1. $m \geq 2$. Let $z=Z(d)$. Since $z \geq 1, z=A_{j, k}$ for some $j, k \geq 1$. Therefore, $W_{i}=A_{j, k+i}$ for $i \geq 0$.
Case 2. $m<2$. Let $z=Z\left(S^{-m+2} d\right)$. Since $z \geq 1, z=A_{j, 1}$ for some $j \geq 1$. Thus, $W_{-m+2+i}=$ $A_{j, 1+i}$ for $i \geq 0$.

David R. Morrison [5] established the Fibonacci case $k=2$ of Theorem 4 using Wythoff pairs.
We illustrate the proof of Theorem 4 with two examples. For both examples we will again use the 3 -bonacci (tribonacci) sequence

| $i$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $X_{i}$ | 0 | 1 | 1 | 2 | 4 | 7 | 13 | 24 | 44 | 81 | 149 | 274 | 504 |

and the 3 -Zeckendorf array $A$ given by

POSITIVE K-BONACCI-LIKE SEQUENCES AND THE K-ZECKENDORF ARRAY

| 1 | 2 | 4 | 7 | 13 | 24 | 44 | 81 | 149 | 274 | 504 | $\cdots$ |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 3 | 6 | 11 | 20 | 37 | 68 | 125 | 230 | 423 | 778 | 1431 |  |
| 5 | 9 | 17 | 31 | 57 | 105 | 193 | 355 | 653 | 1201 | 2209 |  |
| 8 | 15 | 28 | 51 | 94 | 173 | 318 | 585 | 1076 | 1979 | 3640 |  |
| 10 | 19 | 35 | 64 | 118 | 217 | 399 | 734 | 1350 | 2483 | 4567 |  |
| 12 | 22 | 41 | 75 | 138 | 254 | 467 | 859 | 1580 | 2906 | 5345 |  |
| 14 | 26 | 48 | 88 | 162 | 298 | 548 | 1008 | 1854 | 3410 | 6272 |  |
| 16 | 30 | 55 | 101 | 186 | 342 | 629 | 1157 | 2128 | 3914 | 7199 |  |
| 18 | 33 | 61 | 112 | 206 | 379 | 697 | 1282 | 2358 | 4337 | 7977 |  |
| $\vdots$ |  |  |  |  |  |  |  |  |  |  |  |

Consider the positive 3 -bonacci-like sequence

| $i$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $W_{i}$ | 1 | 3 | 4 | 8 | 15 | 27 | 50 | 92 |

To find a coefficient list $d$ for $\left\{W_{n}\right\}$ we solve the system of equations

$$
\begin{aligned}
& d(1)=1 \\
& d(0)+d(1)=3 \\
& d(-1)+d(0)+2 d(1)=4
\end{aligned}
$$

to obtain the coefficient list

| $i$ | -1 | 0 | 1 |
| :---: | :---: | :---: | :---: |
| $d(i)$ | 0 | 2 | 1 |

This coefficient sequence is already weakly Zeckendorf. Using the second half of the proof of Lemma 3, the bad sum is 3 . We produce the equivalent $d$ coefficient list by the borrow $B_{0}$ followed by the carry $C_{2}$ to obtain the $d$ coefficient list

| $i$ | -3 | -2 | -1 | 0 | 1 | 2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 1 | 1 | 0 | 0 | 0 | 1 |

Using the recurrence relation for the tribonacci sequence we see that $X_{-3}=-1$ and $X_{-2}=1$, so we can show that $Z\left(S^{i} d\right)=W_{i}$. Since $m=-3, z=Z\left(S^{5} d\right)=27$. But $27=A_{13,1}$. So $W_{5+i}=A_{13,1+i}$ for $i \geq 0$.

Next, consider the positive 3-bonacci-like sequence

| $i$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $W_{i}$ | 6 | 11 | 20 | 37 | 68 | 125 | 230 | 423 |

To find a coefficient list $d$ for $\left\{W_{n}\right\}$ we solve the system of equations

$$
\begin{aligned}
& d(1)=6 \\
& d(0)+d(1)=11 \\
& d(-1)+d(0)+2 d(1)=20
\end{aligned}
$$

to obtain the coefficient list

THE FIBONACCI QUARTERLY

| $i$ | -1 | 0 | 1 |
| :---: | :---: | :---: | :---: |
| $d(i)$ | 3 | 5 | 6 |

Now we need the first half of the proof of Lemma 3. Using a sequence of carries, each new coefficient list will have a smaller sum than the previous coefficient list. First, we do the carry $C_{2}$ to obtain the equivalent $d$ coefficient list

| $i$ | -1 | 0 | 1 | 2 |
| :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 2 | 4 | 5 | 1 |

Next, we do the carry $C_{3}$ to obtain the $d$ coefficient list

| $i$ | -1 | 0 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 2 | 3 | 4 | 0 | 1 |

Next we do the carry $C_{2}$ to obtain the $d$ coefficient list

| $i$ | -1 | 0 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 1 | 2 | 3 | 1 | 1 |

Next, we do the carry $C_{4}$ we obtain the $d$ coefficient list

| $i$ | -1 | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 1 | 2 | 2 | 0 | 0 | 1 |

Next, we do the carry $C_{2}$ to obtain the $d$ coefficient list

| $i$ | 0 | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $d(i)$ | 1 | 1 | 1 | 0 | 1 |

Finally, doing the carry $C_{3}$, we obtain the $d$ coefficient list

| $i$ | 0 | 1 | 2 | 3 | 4 |
| :---: | :--- | :--- | :--- | :--- | :--- |
| $d(i)$ | 0 | 0 | 0 | 1 | 1 |

Since $m=3, z=Z(d)=6$. But $6=A_{2,2}$. Therefore, $W_{i}=A_{2,2+i}$ for $i \geq 0$.

## Acknowledgment

The authors wish to express their appreciation to the anonymous referee for the careful reading and the helpful comments and suggestions that improved the quality of this paper.
