# GENERALIZED ZECKENDORF THEOREM 

## V. E. HOGGATT, JR.

San Jose State College, San Jose, California
DझDICATED TO DR. E. ZECKENDORF

## 1. INTRODUCTION

The Zeckendorf theorem states that every positive integer can be uniquely represented as the sum of distinct Fibonacci numbers if no two consecutive Fibonacci numbers are used in any given sum.
D. E. Daykin [1] proved the converse of the Zeckendorf theorem. Keller [2] generalized the Zeckendorf theorem and proved a restricted converse for monotone increasing integer sequences. Hence we generalize the Zeckendorf theorem in a different way and also get a restricted converse. This leaves two open questions as to validity of the unrestricted converse theorems.

## 2. THE GENERALIZED ZECKENDORF THEOREM

Theorem 1. Let $U_{0}=0, U_{1}=1$, and $U_{n+2}=k U_{n+1}+U_{n}(n \geq 0$, $k \geq 1$ ), then every positive integer $N$, has a unique representation in the form

$$
N=\epsilon_{1} \mathrm{U}_{1}+\epsilon_{2} \mathrm{U}_{2}+\cdots+\epsilon_{\mathrm{n}} \mathrm{U}_{\mathrm{n}}
$$

where

$$
\left.\begin{array}{l}
\epsilon_{1}=0,1,2,3, \cdots, \text { or } k-1 \\
\epsilon_{1}=0,1,2,3, \cdots, \text { or } k \\
\text { If } \epsilon_{i}=k, \text { then } \epsilon_{i-1}=0
\end{array}\right\} i \geq 2
$$

First we prove two useful lemmas.
Lemma 1. (i) $U_{2 n}=k\left(U_{2 n-1}+\cdots+U_{3}+U_{1}\right)$
(ii) $\mathrm{U}_{2 \mathrm{n}+1}=\mathrm{k}\left(\mathrm{U}_{2 \mathrm{n}}+\cdots+\mathrm{U}_{2}\right)+1$.

Proof of the Lemma. (The proof will proceed by induction.)

$$
\mathrm{U}_{1}=1, \quad \mathrm{U}_{2}=\mathrm{k}, \quad \text { and } \quad \mathrm{U}_{3}=\mathrm{k}^{2}+1
$$

from recurrence.
(i) $U_{2 n+2}=k U_{2 n+1}+U_{2 n}$
$=k\left\{k U_{2 n}+k U_{2 n-2}+\cdots+\mathrm{kU}_{2}+1\right\}+\left\{\mathrm{kU}_{2 \mathrm{n}-1}+\mathrm{kU}_{2 \mathrm{n}-2}+\cdots+\mathrm{kU}_{3}+\mathrm{kU}_{1}\right\}$
$=\mathrm{k}\left\{\left(\mathrm{kU} \mathrm{Vn}_{2 \mathrm{n}}+\mathrm{U}_{2 \mathrm{n}-1}\right)+\left(\mathrm{kU}_{2 \mathrm{n}-2}+\mathrm{U}_{2 \mathrm{n}-2}\right)+\cdots+\left(\mathrm{kU}_{2}+\mathrm{U}_{1}\right)+1\right\}$
$=k\left\{U_{2 n+1}+U_{2 n-1}+\cdots+U_{3}+1\right\}$
$=k\left\{U_{2 n+1}+U_{2 n-1}+\cdots+U_{3}+U_{1}\right\}$, since $U_{1}=1$. End of proof of (i).
(ii) $U_{2 n+3}=k U_{2 n+2}+U_{2 n+1}$
$\left.=\mathrm{k}\left\{\mathrm{kU}_{2 \mathrm{n}+1}+\cdots+\mathrm{kU}_{3}+\mathrm{kU}_{1}\right\}+\mathrm{k}\left\{\mathrm{U}_{2 \mathrm{n}}+\cdots+\mathrm{U}_{2}\right)\right\}+1$
$=\mathrm{k}\left\{\left(\mathrm{k} \mathrm{U}_{2 \mathrm{n}+1}+\mathrm{U}_{2 \mathrm{n}}\right)+\left(\mathrm{kU} \mathrm{Un}_{2 \mathrm{-}}+\mathrm{U}_{2 \mathrm{n}-2}\right)+\cdots+\left(\mathrm{kU}_{3}+\mathrm{U}_{2}\right)\right\}+1+\mathrm{k}^{2} \mathrm{U}_{1}$
$=\mathrm{k}\left\{\mathrm{U}_{2 \mathrm{n}+2}+\mathrm{U}_{2 \mathrm{n}}+\cdots+\mathrm{U}_{4}+\mathrm{kU}_{1}\right\}+1$
$=\mathrm{k}\left\{\mathrm{U}_{2 \mathrm{n}+2}+\mathrm{U}_{2 \mathrm{n}}+\cdots+\mathrm{U}_{4}+\mathrm{U}_{2}\right\}+1$, since $\mathrm{U}_{1}$ and $\mathrm{U}_{2}=\mathrm{k}$.

Lemma 2.

$$
\left\{\begin{array}{l}
\mathrm{U}_{2 \mathrm{n}}-1=\mathrm{k}\left(\mathrm{U}_{2 \mathrm{n}-1}+\cdots+\mathrm{U}_{3}\right)+(\mathrm{k}-1) \mathrm{U}_{1} \\
\mathrm{U}_{2 \mathrm{n}+1}-1=\mathrm{k}\left(\mathrm{U}_{2 \mathrm{n}}+\mathrm{U}_{2 \mathrm{n}-2}+\cdots+\mathrm{U}_{2}\right)
\end{array}\right.
$$

Proof of Lemma 2. Both parts follow easily from Lemma 1. We need to know the maximum admissible sum using $U_{1}, U_{2}, \cdots, U_{m}$, subject to the coefficient constraints of Theorem 1.

$$
\begin{aligned}
\mathrm{U}_{2 \mathrm{n}}-1 & =\mathrm{k}\left(\mathrm{U}_{2 \mathrm{n}-1}+\mathrm{U}_{2 \mathrm{n}-3}+\cdots+\mathrm{U}_{1}\right)-1 \\
& =\mathrm{k}\left(\mathrm{U}_{2 \mathrm{n}-1}+\mathrm{U}_{2 \mathrm{n}-3}+\cdots+\mathrm{U}_{3}\right)+(\mathrm{k}-1) \mathrm{U}_{1}
\end{aligned}
$$

Thus the maximum admissible sum using

$$
\mathrm{U}_{1}, \quad \mathrm{U}_{2}, \quad \mathrm{U}_{3}, \quad \cdots, \quad \mathrm{U}_{2 \mathrm{n}-1}
$$

is $U_{2 n}-1$. Now,

$$
\mathrm{U}_{2 \mathrm{n}+1}-1=\mathrm{k}\left(\mathrm{U}_{2 \mathrm{n}}+\mathrm{U}_{2 \mathrm{n}-2}+\cdots+\mathrm{U}_{4}+\mathrm{U}_{2}\right)
$$

Thus the maximum admissible sum using

$$
\mathrm{U}_{1}, \quad \mathrm{U}_{2}, \quad \mathrm{U}_{3}, \quad \cdots, \quad \mathrm{U}_{2 \mathrm{n}}
$$

is $U_{2 n+1}-1$, since $U_{2}$ has coefficient $k, U_{1}$ can have only coefficient zero.

Proof of the Theorem. The proof will proceed by induction. Verification for $\mathrm{s}=1, \mathrm{~m}<\mathrm{U}_{2}=\mathrm{k}$ implies $\mathrm{n}=\mathrm{n} \cdot \mathrm{U}_{1}$. Assume every integer $\mathrm{n}<\mathrm{U}_{\mathrm{S}+1}$ has a unique admissible representation using only $\mathrm{U}_{1}, \mathrm{U}_{2}, \mathrm{U}_{3}, \cdots$ $\mathrm{U}_{\mathrm{s}}$. The maximum such representation has sum $\mathrm{U}_{\mathrm{S}+1}-1$ by Lemma 2. Thus $U_{S+1}$ is its own unique representation. For the representations for numbers

$$
\mathrm{jU}_{\mathrm{S}+1} \leq \mathrm{n}^{\prime}<(\mathrm{j}+1) \mathrm{U}_{\mathrm{S}+1} \quad 1 \leq \mathrm{j} \leq \mathrm{k}-2
$$

we simply add $j \mathrm{U}_{\mathrm{S}+1}$ to the representations for $1 \leq \mathrm{n} \leq \mathrm{U}_{\mathrm{S}+1}$ to get a unique representation. The coefficient of $U_{S}$ can be $k$ since the coefficient of $\mathrm{U}_{\mathrm{S}+1}<\mathrm{k}$. In the interval

$$
\mathrm{k}_{\mathrm{S}+1}<\mathrm{n}^{\prime \prime}<\mathrm{U}_{\mathrm{S}+2}
$$

the representations cannot contain $U_{S}$ thus the greatest admissible representation uses $U_{1}, \mathrm{U}_{2}, \cdots, \mathrm{U}_{\mathrm{S}-1}$ whose maximal admissible sum is $\mathrm{U}_{\mathrm{S}}-1$. Thus we add to $\mathrm{kU}_{\mathrm{S}+1}$ a unique representation for $\mathrm{n} \leq \mathrm{U}_{\mathrm{S}}-1$. Thus we have now covered the interval $\mathrm{U}_{\mathrm{S}+1}<\mathrm{n}<\mathrm{U}_{\mathrm{S}+2}$ and furthermore each such constructed representation is UNIQUE. The proof of the Theorem is complete by mathematical induction. END OF PROOF.

## 3. THE RESTRICTED CONVERSE

TO THE GENERALIZED ZECKENDORF THEOREM
Definition: For fixed integer $K \geq 1$, a sequence $\left\{V_{n}\right\}_{1}^{\infty}$ of positive integers will be called a Zeckendorf K-basis (or briefly a K-basis) if every positive integer $n$ has a unique representation in the form

$$
\begin{equation*}
\mathrm{n}=\sum_{\mathrm{i}=1}^{\mathrm{m}} \epsilon_{\mathrm{i}} \mathrm{~V}_{\mathrm{i}} \tag{1}
\end{equation*}
$$

where the coefficients $\epsilon_{i}$ satisfy constraints
(2)

$$
\left\{\begin{array}{l}
\epsilon_{1}=0,1, \cdots, K-1 \\
\epsilon_{i}=0,1, \cdots, K \quad \text { for } \quad i \geq 2 \\
\epsilon_{i-1}=0 \text { if } \epsilon_{i}=K \quad \text { for } \quad i \geq 2
\end{array}\right.
$$

A representation in form (1) with coefficients satisfying (2) will be called admissible.

Lemma 3. If $\left\{\mathrm{V}_{\mathrm{n}}\right\}_{1}^{\infty}$ is a $K$-basis with $\mathrm{K} \geq 2$, then $\mathrm{V}_{\mathrm{j}} \neq \mathrm{V}_{\mathrm{n}}$ for j $\neq \mathrm{n}, \quad 1 \leq \mathrm{j}, \mathrm{n}<\infty$.

Proof. Obvious from uniqueness requirement. (For $K=1, V_{1}=V_{2}$, but $\mathrm{V}_{1}$ has a zero coefficient in any admissible representation.)

Lemma 4. If $\left\{\mathrm{V}_{\mathrm{n}}\right\}_{1}^{\infty}$ is a non-decreasing K -basis, then $\mathrm{V}_{\mathrm{n}}$ for $\mathrm{n} \geq 2$ is characterized as the smallest positive integer not representable in admissible form using only $V_{1}, V_{2}, \cdots, V_{n-1}$.

Proof. Let $N_{n}=$ smallest positive integer not capable of being represented in admissible form using only $V_{1}, V_{2}, \cdots, V_{n-1}$. If $N_{n}>V_{n}$, then $V_{n}$ would have two admissible representations, thereby contradicting uniqueness. On the other hand, if $\mathrm{N}_{\mathrm{n}}<\mathrm{V}_{\mathrm{n}}$, then $\mathrm{N}_{\mathrm{n}}$ itself would have no admissible representation (recalling $\left\{\mathrm{V}_{\mathrm{n}}\right\}$ is non-decreasing).

Theorem 2. Let $\left\{\mathrm{V}_{\mathrm{n}}\right\}_{1}^{\infty}$ be a non-decreasing K -basis with $\mathrm{K} \geq 1$. Then defining $\mathrm{V}_{0}=0$, we have

$$
\begin{equation*}
\mathrm{V}_{\mathrm{n}+2}=\mathrm{K} \mathrm{~V}_{\mathrm{n}+1}+\mathrm{V}_{\mathrm{n}} \quad \text { for } \quad \mathrm{n} \geq 0, \mathrm{~K} \geq 1 \tag{3}
\end{equation*}
$$

Proof. Since K = 1 corresponds to Zeckendorf's theorem, we may confine our attention for $K \geq 2$. Then $\left\{\mathrm{V}_{\mathrm{n}}\right\}_{1}^{\infty}$ is strictly increasing by Lemma 3. Clearly $V_{1}=1$, and Lemma 4 in conjunction with the coefficient constraints (2) implies $\mathrm{V}_{2}=\mathrm{K}$ [since $\epsilon_{1} \mathrm{~V}_{1}$ can represent only the integers $1,2, \cdots, K-1]$.

For fixed $K \geq 2$, let $\left\{U_{n}\right\}_{1}^{\infty}$ be the sequence defined by $U_{0}=0, U_{1}$ $=1$ and $U_{n+2}=K U_{n+1}+U_{n}$ for $n \geq 0$. Then $V_{0}=U_{0}, V_{1}=U_{1}, V_{2}=U_{2}$. Now, assume as an induction hypothesis that $V_{i}=U_{i}$ for $i=1,2, \cdots, n$, where $n \geq 2$. We wish to show $V_{n+1}=U_{n+1}$. Contained in the proof of the generalized Zeckendorf theorem is the fact that the smallest integer not representable by an admissible combination of $U_{1}, U_{2}, \cdots, U_{n}$ is $U_{n+1}$. Since $\mathrm{U}_{\mathrm{i}}=\mathrm{V}_{\mathrm{i}}$ for $\mathrm{i}=1, \cdots, \mathrm{n}$, Lemma 2 implies $\mathrm{V}_{\mathrm{n}+1}=\mathrm{U}_{\mathrm{n}+1}$ and the theorem is established.

I wish to thank John L. Brown, Jr., for the details of the restricted converse theorem.

FIBONACCI NOTE SERVICE
The Fibonacci Quarterly is offering a service in which it will be possible for its readers to secure background notes for articles. This will apply to the following:
(1) Short abstracts of extensive results, derivations, and numerical data.
(2) Brief articles summarizing a large amount of research.
(3) Articles of standard size for which additional background material may be obtained.
Articles in the Quarterly for which this note service is available will indicate the fact together with the number of pages in question. Requests for these notes should be made to:

> Brother Alfred Brousseau
> St. Mary's College
> IMoraga, Calif. 94575

The notes will be Xeroxed.
The price for this service is four cents a page (including postage, materials and labor.)

FIBONACCI NEWS
The title of our new number tables book, to come out soon, is:
FIBONACCI AND RELATED NUMBER THEORETIC TABLES. 1972.
Reference tables related to the sequence of articles on representations and their page numbers are shown on page 112 .
