# remark on a paper by duncan and brown on the sequence OF LOGARITHMS OF CERTAIN RECURSIVE SEQUENCES 

L. KUIPERS<br>Southern Illinois University, Carbondale, Illinois<br>and<br>JAU-SHYONG SHIUE<br>National Chengchi University, Taiwan

In the present paper, it is shown that the main theorem in [1], see p. 484, can be established by using one of J. G. van der Corput's difference theorems [2]. Moreover, by using a theorem of C. L VandenEynden [3] we show the property that the sequence of the integral parts of the logarithms of the recursive sequence under consideration is also uniformly distributed modulo m for any integer $\mathrm{m} \geq 2$.

Lemma 1. Let $\left(x_{n}\right), n=1,2, \cdots$, be a sequence of real numbers. If

$$
\lim _{n \rightarrow \infty}\left(x_{n+1}-x_{n}\right)=\alpha
$$

$\alpha$ irrational, then $\left(x_{n}\right)$ is u.d. $\bmod 1([2]$, p. 378).
Lemma 2. Let $\left(x_{n}\right), n=1,2, \cdots$, be a sequence of real numbers. Assume that the sequence $\left(x_{n} / m\right), n=1,2, \cdots$, is $u$.d. $\bmod 1$ for all integers $m \geq 2$. Then the sequence of the integral parts $\left(\left[\mathrm{x}_{\mathrm{n}}\right]\right), \mathrm{n}=1,2, \cdots$, is u.d. $\bmod \mathrm{m} \quad[3]$.

For the notion of uniform distribution modulo $m$ we refer to [4].
Theorem. Let $\left(V_{n}\right), \mathrm{n}=1,2, \cdots$, be a sequence generated by the recursion relation

$$
\begin{equation*}
\mathrm{v}_{\mathrm{n}+\mathrm{k}}=\mathrm{a}_{\mathrm{k}-1} \mathrm{v}_{\mathrm{n}+\mathrm{k}-1}+\cdots+\mathrm{a}_{1} \mathrm{v}_{\mathrm{n}+1}+\mathrm{a}_{0} \mathrm{v}_{\mathrm{n}}, \quad \mathrm{n} \geq 1 \tag{1}
\end{equation*}
$$

where $a_{0}, a_{1}, \cdots, a_{k-1}$ are non-negative rational coefficients with $a_{0} \neq 0, k$ is a fixed integer, and

$$
\begin{equation*}
\mathrm{V}_{1}=\gamma_{1}, \quad \mathrm{~V}_{2}=\gamma_{2}, \quad \cdots, \quad \mathrm{~V}_{\mathrm{k}}=\gamma_{\mathrm{k}} \tag{2}
\end{equation*}
$$

are given positive values for the initial terms. It is assumed that the polynomial

$$
x^{k}-a_{k-1} x^{k-1}-\cdots-a_{1} x-a_{0}
$$

has k distinct real roots $\beta_{1}, \beta_{2}, \cdots, \beta_{\mathrm{k}}$ satisfying $0<\left|\beta_{\mathrm{k}}\right|<\cdots<\left|\beta_{\mathrm{k}}\right|$ and such that none of the roots has magnitude equal to 1 . Then:

1. The sequence $\left(\log V_{n}\right), n=1,2, \cdots$, is $u . d . \bmod 1$ [1].
2. The sequence $\left(\left[\log V_{n}\right]\right), n=1,2, \cdots$, is $u$.d.

Proof. By (1) and (2), we have that

$$
\mathrm{V}_{\mathrm{n}}=\sum_{\mathrm{j}=1}^{\mathrm{k}} \alpha_{\mathrm{j}} \beta_{\mathrm{j}}^{\mathrm{n}} \quad(\mathrm{n} \geq 1)
$$

where the coefficients $\alpha_{1}, \alpha_{2}, \cdots, \alpha_{k}$ are uniquely determined by assumption (2). Let p be the largest value of $j$ for which $a_{j} \neq 0$. We have $p \geq 1$. Hence

$$
\mathrm{V}_{\mathrm{n}}=\sum_{\mathrm{j}=1}^{\mathrm{p}} \alpha_{\mathrm{j}} \beta_{\mathrm{j}}^{\mathrm{p}}
$$

Now

$$
\frac{\mathrm{V}_{\mathrm{n}+1}}{\mathrm{~V}_{\mathrm{n}}}=\frac{\alpha_{1} \beta_{1}^{\mathrm{n}+1}+\cdots+\alpha_{\mathrm{p}} \beta_{\mathrm{p}}^{\mathrm{n}+1}}{\alpha_{1} \beta_{1}^{\mathrm{n}}+\cdots+\alpha_{\mathrm{p}} \beta_{\mathrm{p}}^{\mathrm{n}}} \rightarrow \beta_{\mathrm{p}} \quad \text { as } \quad \mathrm{n} \rightarrow \infty
$$

since $\beta_{1}^{\mathrm{n}} \mid \beta_{\mathrm{p}}^{\mathrm{n}} \rightarrow 0($ as $\mathrm{n} \rightarrow \infty), \mathrm{i}=1,2, \cdots, \mathrm{p}-1$, because of the conditions on the absolute values of the $\beta_{j}$. (From the conditions follows that $\beta_{p}>0$.) Hence we have that

$$
\log \mathrm{V}_{\mathrm{n}+1}-\log \mathrm{V}_{\mathrm{n}} \rightarrow \log \beta_{\mathrm{p}}, \quad \text { as } \quad \mathrm{n} \rightarrow \infty
$$

The number $\beta_{\mathrm{p}}$ is algebraic and therefore $\log \beta_{\mathrm{p}}$ is an irrational number (see [1]). Hence Lemma 1 applies and we obtain that the sequence $\left(\log V_{n}\right)$ is $u . d . \bmod 1$. This proves Duncan and Brown's result.

In order to show the second part of the theorem we observe that for every integer $\mathrm{m} \geq 2$

$$
\frac{\log V_{n+1}}{m}-\frac{\log V_{n}}{m} \rightarrow \frac{\beta_{p}}{m}, \quad \text { as } \quad n \rightarrow \infty
$$

hence the sequence $\left(\left(\log V_{n}\right) / m\right), n=1,2, \cdots$ is $u . d . \bmod 1$, and according to Lemma 2 we obtain that the sequence of the integral parts $\left(\left[\log V_{n}\right]\right)$ is $u . d . \bmod m$ for every integer $\mathrm{m} \geq 2$.

Remark. By restricting the order of the recurrence we may relax the conditions on the coefficients $\mathrm{a}_{\mathrm{j}}$ and the initial values of $\mathrm{V}_{\mathrm{n}}$. The values of elements of $\left(\mathrm{V}_{\mathrm{n}}\right)$ can be negative in that case, and so we obtain a result regarding the logarithms of the absolute value of $\mathrm{V}_{\mathrm{n}}$.

Let $\left(V_{n}\right), n=1,2, \cdots$, be a sequence generated by the recurrence

$$
\mathrm{V}_{\mathrm{n}+2}=\mathrm{a}_{1} \mathrm{~V}_{\mathrm{n}+1}+\mathrm{a}_{0} \mathrm{~V}_{\mathrm{n}}, \quad \mathrm{n} \geq 1
$$

where $V_{1}=\gamma_{1}, V_{2}=\gamma_{2}$. We assume that $\gamma_{1}, \gamma_{2}, a_{0}$ and $a_{1}$ are rational numbers, where $\gamma_{1}$ and $\gamma_{2}$ are $\neq 0$, and $a_{0}$ and $a_{1}$ not both 0 . Moreover, it is assumed that the polynomial $x^{2}-a_{1} x-a_{0}$ has distinct real roots, $\beta_{1}$ and $\beta_{2}$, one of which has an absolute value
different from 1. Then the sequence $\left(\log \left|\mathrm{V}_{\mathrm{n}}\right|\right)$ is $\mathrm{u} . \mathrm{d}$. $\bmod 1$, and the sequence of integral parts $\left(\left[\log \left|V_{n}\right|\right]\right)$ is u.d.

Proof. We have

$$
\mathrm{V}_{\mathrm{n}}=\frac{\left(\gamma_{2}-\gamma_{1} \beta_{2}\right) \beta_{1}^{\mathrm{n}-1}-\left(\gamma_{2}-\gamma_{1} \beta_{1}\right) \beta_{2}^{\mathrm{n}-1}}{\beta_{1}-\beta_{2}}
$$

where

$$
\beta_{1}=\frac{1}{2}\left(a_{1}+\sqrt{a_{1}^{2}+4 a_{0}}\right), \quad \beta_{2}=\frac{1}{2}\left(a_{1}-\sqrt{a_{1}^{2}+4 a_{0}}\right) .
$$

Now

$$
\log \left|\mathrm{V}_{\mathrm{n}+1}\right|-\log \left|\mathrm{v}_{\mathrm{n}}\right|=\log \left|\frac{\left(\gamma_{2}-\gamma_{1} \beta_{2}\right) \beta_{1}^{\mathrm{n}}-\left(\gamma_{2}-\gamma_{1} \beta_{1}\right) \beta_{2}^{\mathrm{n}}}{\left(\gamma_{2}-\gamma_{1} \beta_{2}\right) \beta_{1}^{\mathrm{n}-1}-\left(\gamma_{2}-\gamma_{1} \beta_{1}\right) \beta_{2}^{\mathrm{n}-1}}\right|
$$

We may suppose that $\left|\beta_{1}\right| \neq 1,\left|\beta_{2} / \beta_{1}\right|<1$.
Since $\log \left|\mathrm{V}_{\mathrm{n}+1}\right|-\log \left|\mathrm{V}_{\mathrm{n}}\right| \rightarrow \log \left|\beta_{1}\right|$ as $\mathrm{n} \rightarrow \infty$, and as $\left|\beta_{1}\right|$ is algebraic when $\beta_{1}$ is algebraic, we may complete the proof in the same way as done above.
