$$
b(2 k+1)=b(k+1)+b(k) \quad \text { for } \quad k \geq 1
$$

For $\mathrm{n} \geq 1$, show the following:
(a)

$$
\mathrm{b}\left(\left[2^{\mathrm{n}+1}+(-1)^{\mathrm{n}} / 3\right)=\mathrm{F}_{\mathrm{n}+1}\right.
$$

(b)

$$
\mathrm{b}\left(\left[7 \cdot 2^{\mathrm{n}-1}+(-1)^{\mathrm{n}}\right] / 3\right)=\mathrm{L}_{\mathrm{n}}
$$

Solution by Michael Yoder, Student, Albuquerque Academy, Albuquerque, New Mexico.
(a) For $\mathrm{n}=0,1$ the formula is easily verified. Assume it is true for $\mathrm{n}-2$ and $\mathrm{n}-1$ with $\mathrm{n} \geq 2$; then if n is even,

$$
\begin{aligned}
\mathrm{b}\left[\left(2^{\mathrm{n}+1}+1\right) / 3\right] & =\mathrm{b}\left[\left(2^{\mathrm{n}}-1\right) / 3+\mathrm{b}\left(2^{\mathrm{n}}+2\right) / 3\right] \\
& =\mathrm{F}_{\mathrm{n}}+\mathrm{b}\left[\left(2^{\mathrm{n}-1}+1\right) / 3\right] \\
& =\mathrm{F}_{\mathrm{n}}+\mathrm{F}_{\mathrm{n}-1}=\mathrm{F}_{\mathrm{n}+1} .
\end{aligned}
$$

Similarly, if n is odd,

$$
\mathrm{b}\left[\left(2^{\mathrm{n}+1}-1 / 3\right]=\mathrm{F}_{\mathrm{n}+1}\right.
$$

(b) For $\mathrm{n}=1,2$ the theorem is true; and by exactly the same argument as in (a), it follows by induction for all positive integers $n$.
Also solved by Herta T. Freitag and the Proposer.

## SOLUTIONS TO PROBLEMS

1. 

$$
5 n^{3}-4 n^{2}+3 n-8
$$

2. $3 \mathrm{n}^{2}-8 \mathrm{n}+4$ and the Fibonacci sequence: $1,4,5,9,14, \cdots$.
3. $7 n^{3}+3 n^{2}-5 n+2+3 x 2^{n}$.
4. 

$4 \mathrm{n}+3+3(-1)^{\mathrm{n}}$.
5. $2 n^{3}-3 n^{2}-n+5$ and the Fibonacci sequence $4 L_{n}$.
